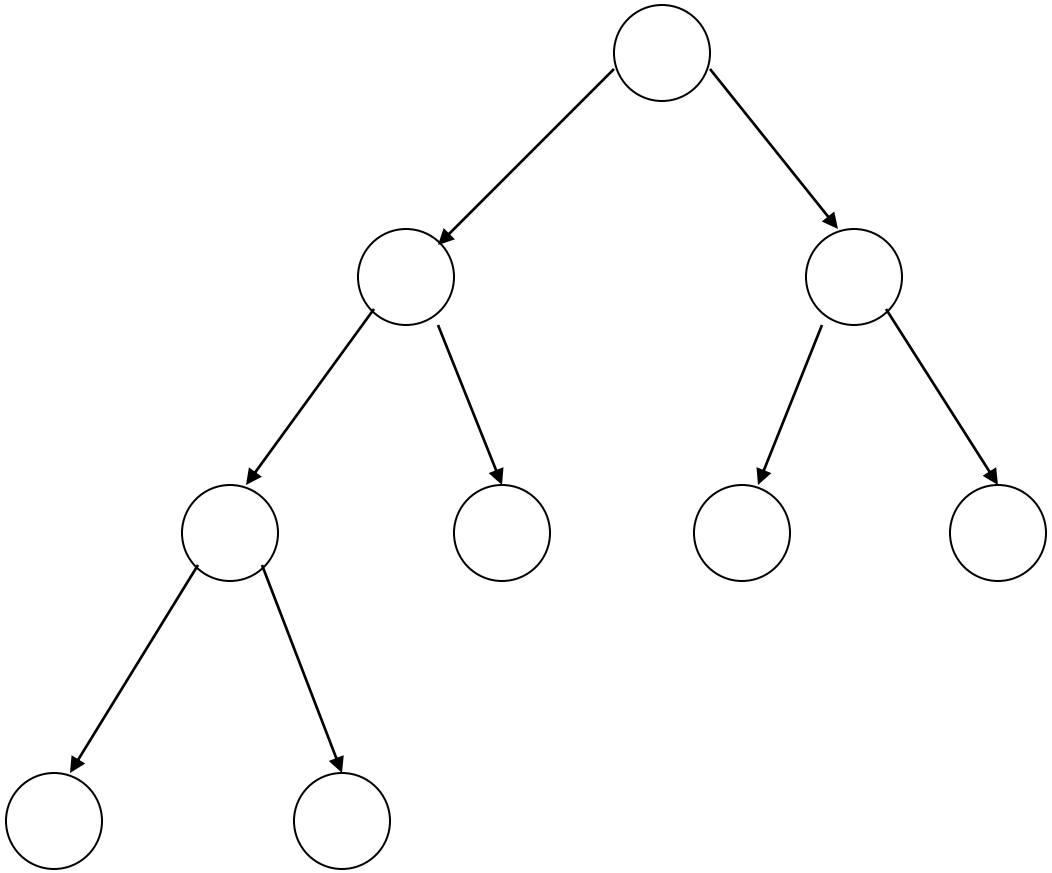
Binary Trees



Proof Techniques

- Proof by induction
- Proof by contradiction
- Proof by construction

Induction

We have statements $P_1, P_2, P_3, \ldots$

If we know

- for some b that $P_1, P_2, \ldots, P_b$ are true
- for any k >= b that

$P_1, P_2, \ldots, P_k$ imply P_{k+1}

Then

Every P_i is true

Proof by Induction

- Inductive basis

  Find $P_1, P_2, \ldots, P_b$ which are true

- Inductive hypothesis

  Let's assume $P_1, P_2, \ldots, P_k$ are true,

  for any k >= b

- Inductive step

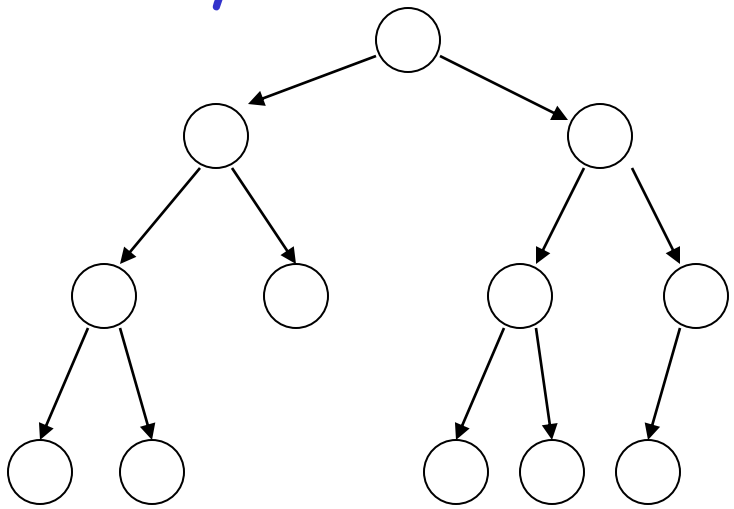
  Show that P_{k+1} is true

Example

Theorem: A binary tree of height n has at most 2^n leaves.

Proof by induction:

let L(i) be the maximum number of leaves of any subtree at height i



We want to show: $L(i) <= 2^i$

- Inductive basis

  $L(0) = 1$ (the root node) ○

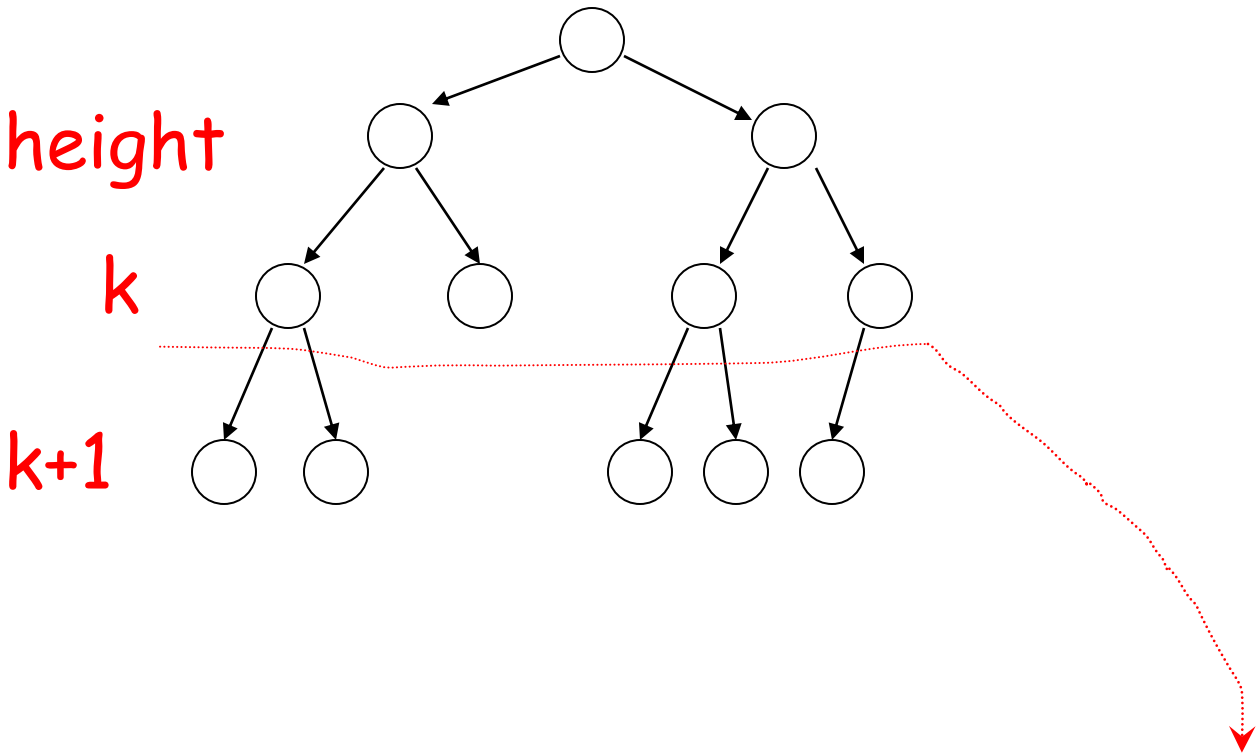
- Inductive hypothesis

  Let's assume $L(i) <= 2^i$ for all $i = 0, 1, \ldots, k$

- Induction step

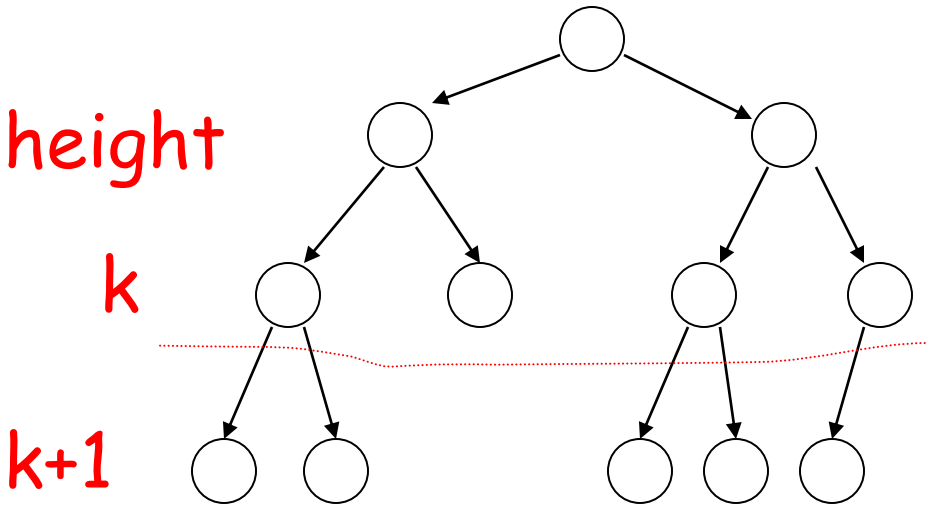
  we need to show that $L(k + 1) <= 2^{k+1}$

Induction Step



From Inductive hypothesis: $L(k) <= 2^k$

Induction Step



$L(k) <= 2^k$

$L(k+1) <= 2 * L(k) <= 2 * 2^k = 2^{k+1}$

(we add at most two nodes for every leaf of level k)

Remark

Recursion is another thing

Example of recursive function:

$$f(n) = f(n-1) + f(n-2)$$

$$f(0) = 1, \quad f(1) = 1$$

Proof by Contradiction

We want to prove that a statement P is true

- we assume that P is false
- then we arrive at an incorrect conclusion
- therefore, statement P must be true

Example

Theorem: $\sqrt{2}$ is not rational

Proof:

Assume by contradiction that it is rational

$\sqrt{2} = n/m$

n and m have no common factors

We will show that this is impossible

$\sqrt{2} = n/m$ ⇒ $2\,m^2 = n^2$

Therefore, n^2 is even ⇒ n is even

$n = 2\,k$

$2\,m^2 = 4k^2$ ⇒ $m^2 = 2k^2$ ⇒ m is even

$m = 2\,p$

Thus, m and n have common factor 2

Contradiction!

Proof by Construction

We want to prove that a statement about something with a property is true

- constructing a concrete example with a property to show that something having that property exists.
- constructive proof is in contrast to a non-constructive proof which does not provide a means of constructing an example.

Example 1

16 can be exactly divided.

Proof

- A concrete example is 16/2. Therefore, the statement is true.

End

Example 2

There exist two irrational numbers which make a^b rational.

Proof

Let a=b= $\sqrt{2}$

case 1: $\sqrt{2}^{\sqrt{2}}$ is rational. done, otherwise

case 2: let a= $\sqrt{2}^{\sqrt{2}}$, then $(\sqrt{2}^{\sqrt{2}})^{\sqrt{2}} = \sqrt{2}^{2} = 2$, done.

End

Question

Is example 2 the constructive proof?

Why if yes? Why if no?

Example 3

Show that there is no "largest integer".

Proof

Let n be any integer.

Let $m = n+1$

m is an integer

$m > n$

Therefore m is an integer that is larger than n

Therefore, for any integer there exists an integer $m = n + 1$ that is larger than it.

End

Question

Is example 3 the constructive proof?

Why if yes? Why if no?

Example 4

Show that there is no "largest" prime number.

Proof

Let n be any prime number

Let $m = n! + 1$, then $m > n$

Case 1:

$m = n! + 1$ is a prime number, then we have constructed a prime number that is larger than the previous prime number.

Case 2:

$m = n! + 1$ is not a prime number, then it has at least one prime factor

Example 4 (Cont.)

Explanation:

If you divide m by any of the prime numbers that are smaller than or equal to n, you will always get a remainder of 1,

because each prime number less than or equal to n divides evenly into n!.

Therefore any prime factors of m must be greater than n.

End

Question

Is example 4 the constructive proof?

Why if yes? Why if no?
